

## Health Advisory:

### SARS Case Reported in Beijing

**April 23, 2004**

This document will be updated as new information becomes available. The current version can always be viewed at <http://www.dhss.state.mo.us/>.

The Missouri Department of Health & Senior Services (DHSS) is now using 4 types of documents to provide important information to medical and public health professionals, and to other interested persons:

**Health Alerts** convey information of the highest level of importance which warrants immediate action or attention from Missouri health providers, emergency responders, public health agencies, and/or the public.

**Health Advisories** provide important information for a specific incident or situation, including that impacting neighboring states; may not require immediate action.

**Health Guidances** contain comprehensive information pertaining to a particular disease or condition, and include recommendations, guidelines, etc. endorsed by DHSS.

**Health Updates** provide new or updated information on an incident or situation; can also provide information to update a previously sent Health Alert, Health Advisory, or Health Guidance; unlikely to require immediate action.

**Health Advisory**  
**April 23, 2004**

**FROM: RICHARD C. DUNN  
DIRECTOR**

**SUBJECT: New Possible SARS Case Reported in Beijing**

On April 22, 2004, the Chinese Ministry of Health reported a possible case of severe acute respiratory syndrome (SARS) in a 20-year-old woman who works as a nurse in a hospital in Beijing. If confirmed, this will be the first case of SARS since January 2004, when Chinese health authorities confirmed SARS coronavirus (SARS-CoV) infection in three persons in Guangdong Province.

According to media reports and information on the World Health Organization (WHO) [http://www.who.int/csr/don/2004\\_04\\_22/en/](http://www.who.int/csr/don/2004_04_22/en/) website, the woman reported onset of fever, cough, and chills on April 5. She was admitted to a hospital in Beijing on April 7 and was transferred to the intensive-care unit at another Beijing hospital on April 14, where she remains in intensive care. On April 22, a panel of Chinese experts diagnosed the 20-year-old patient as a case of possible SARS, based on positive test results for antibodies to SARS-CoV in serum. The source of the patient's infection is unknown at this time.

Beijing public health authorities have initiated an epidemiologic investigation. Of 171 close contacts under medical observation, 5 have developed fever and have been placed in isolation. The Chinese MOH has requested local health authorities in China to enhance surveillance for SARS, influenza-like illness, and pneumonia of unknown etiology. CDC is in close communication with WHO about the newly identified possible case in China and will provide additional information as it becomes available.

In light of this report, CDC is recommending that U.S. physicians maintain a greater index of suspicion for SARS in patients who 1) require hospitalization for radiographically confirmed pneumonia or acute respiratory distress syndrome (ARDS) and 2) who have a history of travel to mainland China (or close contact with an ill person with a history of recent travel to mainland China) in the 10 days before onset of symptoms. When such patients are identified, they should be considered at high risk for SARS-CoV infection and the following actions should be taken:

Office of the Director  
912 Wildwood  
P.O. Box 570

Jefferson City, MO 65102  
Telephone: (800) 392-0272  
Fax: (573) 751-6041

Web site: [www.dhss.state.mo.us](http://www.dhss.state.mo.us)

**Questions should be directed to the Department of Health and Senior Services at 800-392-0272.**

- Patients should immediately be placed in appropriate isolation precautions for SARS (i.e., contact and airborne precautions along with eye protection).
- Patients should promptly be reported to the state or local health department.
- Patients should promptly be tested for evidence of SARS-CoV infection as part of the diagnostic evaluation (see Appendix 2, "Updated Guidelines for Collecting Specimens from Potential SARS Patients," in the CDC document, In the Absence of SARS-CoV Transmission Worldwide: Guidance for Surveillance, Clinical and Laboratory Evaluation, and Reporting” <http://www.cdc.gov/ncidod/sars/absenceofsars.htm>).
- The health department should identify, evaluate, and monitor relevant contacts of the patient, as indicated. In particular, the health status of household contacts or persons who provided care to symptomatic patients should be assessed.

Health care providers are reminded to obtain a travel history for patients presenting with acute respiratory illness. In addition, this new case of possible SARS provides a reminder to all healthcare settings, especially physician offices, outpatient clinics, and emergency departments, of the importance of implementing infection control precautions at the point of first contact with patients who have symptoms of a respiratory infection. These include respiratory hygiene/cough etiquette, hand hygiene, and droplet precautions (i.e., masks for close patient contact). For additional information, see Respiratory Hygiene/Cough Etiquette in Healthcare Settings <http://www.cdc.gov/flu/professionals/infectioncontrol/resphgiene.htm>.

The reported new possible case of SARS in China represents an evolving situation, and CDC will distribute updates as additional information is learned. For more about SARS and the current U.S. SARS control guidelines, see the CDC SARS website <http://www.cdc.gov/ncidod/sarsT>.
